

# CS 154

**Advanced Computability:  
Oracles, Self-Reference,  
Foundations**

# **Next Wednesday (2/17)**

## **Your Midterm: IN CLASS**

**Today: instead of a new homework,  
you'll get an optional (not graded!) practice midterm**

**Solutions to practice midterm will come out during  
the weekend. Same with all remaining HW solutions.**

**When you see the practice midterm...**

**DON'T PANIC!**

**Practice midterm will be harder than midterm**

# **Next Wednesday (2/17)**

## **Your Midterm: IN CLASS**

**Today: instead of a new homework,  
you'll get an optional (not graded!) practice midterm**

**FAQ: What is fair game for the midterm?**

**Everything BEFORE this lecture (Lectures 1-10)**

**FAQ: Can I bring notes?**

**Yes, one single-sided sheet of notes, letter paper**

# Rice's Theorem (Restated)

Suppose  $L$  is a language that satisfies two conditions:

1. (Nontrivial) There are TMs  $M_{\text{YES}}$  and  $M_{\text{NO}}$ ,  
where  $M_{\text{YES}} \in L$  and  $M_{\text{NO}} \notin L$
2. (Semantic) For all TMs  $M_1$  and  $M_2$  such that  
 $L(M_1) = L(M_2)$ ,  $M_1 \in L$  if and only if  $M_2 \in L$

Then,  $L$  is undecidable.

# Recognizability via Logic

**Def.** A decidable predicate  $R(x,y)$  is a proposition about the input strings  $x$  and  $y$ , such that some TM  $M$  implements  $R$ . That is,

for all  $x, y$ ,  $R(x,y)$  is TRUE  $\Rightarrow M(x,y)$  accepts  
 $R(x,y)$  is FALSE  $\Rightarrow M(x,y)$  rejects

Can think of  $R$  as a function from  $\Sigma^* \times \Sigma^* \rightarrow \{T,F\}$

**EXAMPLES:**  $R(x,y)$  = “ $xy$  has at most 100 zeroes”  
 $R(N,y)$  = “TM  $N$  halts on  $y$  in at most 99 steps”

**Theorem: A language  $A \subseteq \Sigma^*$  is *recognizable* if and only if there is a decidable predicate  $R(x, y)$  such that:**

$$A = \{ x \mid \exists y \in \Sigma^* R(x, y) \}$$

**Proof: (1) If  $A = \{ x \mid \exists y R(x, y) \}$  then  $A$  is recognizable**

**Define the TM  $M(x)$ : For all strings  $y \in \Sigma^*$ ,  
If  $R(x, y)$  is true, *accept*.**

**Then,  $M$  accepts exactly those  $x$  s.t.  $\exists y R(x, y)$  is true**

**(2) If  $A$  is recognizable, then  $A = \{ x \mid \exists y R(x, y) \}$**

**Suppose TM  $M$  recognizes  $A$ .**

**Let  $R(x, y)$  be TRUE iff  $M$  accepts  $x$  in  $|y|$  steps**

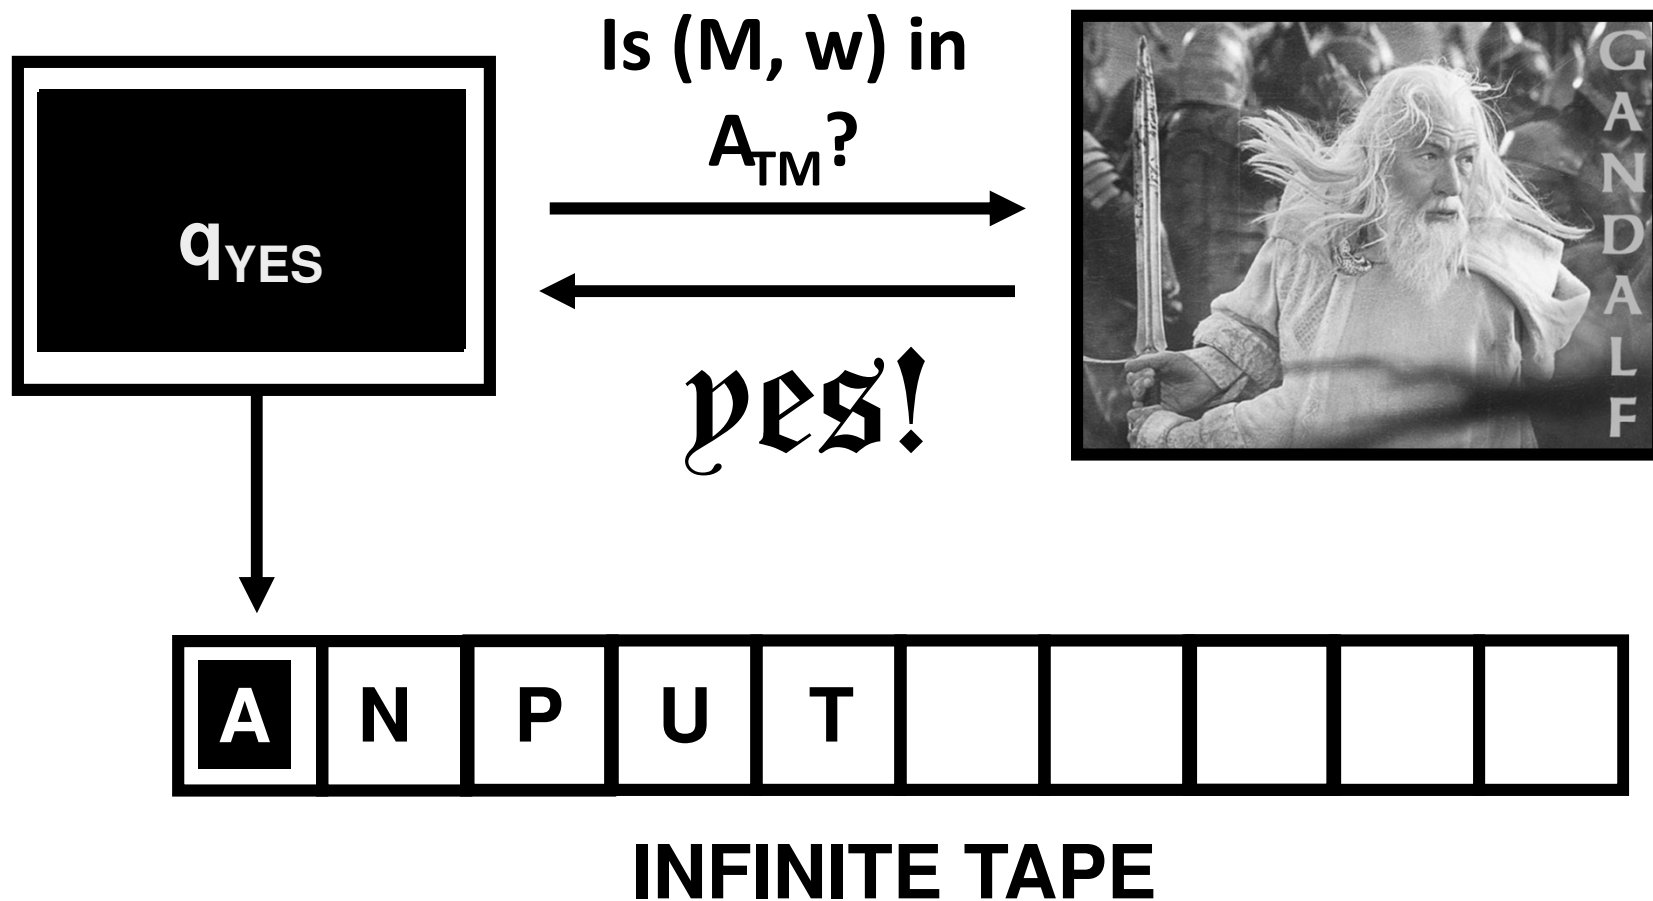

**Then,  $M$  accepts  $x \Leftrightarrow \exists y R(x, y)$**

# Computability With Oracles

**\*We do not condone smoking. Don't do it. It's bad. Kthxbye**

# Oracle Turing Machines

Now leaving reality for a moment....

# Oracle Turing Machines

An oracle Turing machine  $M$  is equipped with a set  $B \subseteq \Gamma^*$  to which a TM  $M$  may ask membership queries on a special “oracle tape”

[Formally,  $M$  enters a special state  $q_?$ ]

and the TM receives a query answer in one step

[Formally, the transition function on  $q_?$  is defined in terms of the *entire oracle tape*:

if the string  $y$  written on the oracle tape is in  $B$ ,  
then state  $q_?$  is changed to  $q_{\text{YES}}$ , otherwise  $q_{\text{NO}}$ ]

**This notion makes sense even if  $B$  is not decidable!**

# How to Think about Oracles?

Think in terms of Turing Machine pseudocode!

An oracle Turing machine  $M$  with oracle  $B \subseteq \Gamma^*$  lets you include the following kind of branching instructions:

“if ( $z$  in  $B$ ) then  $\langle$ do something $\rangle$   
else  $\langle$ do something else $\rangle$ ”

where  $z$  is some string defined earlier in pseudocode.  
By definition, the oracle TM can always check the condition ( $z$  in  $B$ ) in one step

**This notion makes sense even if  $B$  is not decidable!**

**Definition:**  $A$  is recognizable with  $B$   
if there is an *oracle TM*  $M$  with oracle  $B$   
that recognizes  $A$

**Definition:**  $A$  is decidable with  $B$   
if there is an *oracle TM*  $M$  with oracle  $B$   
that decides  $A$

**Language  $A$  “Turing-Reduces” to  $B$**

$$A \leq_T B$$

**$A_{TM}$  is decidable with  $HALT_{TM}$  ( $A_{TM} \leq_T HALT_{TM}$ )**

**We can decide if  $M$  accepts  $w$   
using an ORACLE for the Halting Problem:**

**On input  $(M,w)$ ,  
    If  $(M,w)$  is in  $HALT_{TM}$  then  
        run  $M(w)$  and output its answer.  
    else REJECT.**

**$\text{HALT}_{\text{TM}}$  is decidable with  $A_{\text{TM}}$  ( $\text{HALT}_{\text{TM}} \leq_T A_{\text{TM}}$ )**

**On input  $(M, w)$ , decide if  $M$  halts on  $w$  as follows:**

- 1. If  $(M, w)$  is in  $A_{\text{TM}}$  then ACCEPT**
- 2. Else, switch the accept and reject states of  $M$  to get a machine  $M'$ . If  $(M', w)$  is in  $A_{\text{TM}}$  then ACCEPT**
- 3. REJECT**

**$\leq_T$  versus  $\leq_m$**

**Theorem: If  $A \leq_m B$  then  $A \leq_T B$**

**Proof (Sketch):**

**If  $A \leq_m B$  then there is a computable function  
 $f : \Sigma^* \rightarrow \Sigma^*$ , where for every  $w$ ,**

$$w \in A \iff f(w) \in B$$

**To decide  $A$  on the string  $w$ ,  
just compute  $f(w)$  and “call the oracle” for  $B$**

**Theorem:  $\neg\text{HALT}_{\text{TM}} \leq_T \text{HALT}_{\text{TM}}$**

**Theorem:  $\neg\text{HALT}_{\text{TM}} \not\leq_m \text{HALT}_{\text{TM}}$  *Why?***

# Limitations on Oracle TMs!

The following problem cannot be decided by any TM with an oracle for the Halting Problem:

**SUPERHALT = { (M,x) | M, with an oracle for the Halting Problem, halts on x }**

*We can use the proof by diagonalization!*

**Assume H (with HALT oracle) decides SUPERHALT**

**Define  $D(X) :=$  “if  $H(X,X)$  (with HALT oracle) accepts then LOOP, else ACCEPT.”**

**(D uses a HALT oracle to simulate H)**

**But  $D(D)$  halts  $\Leftrightarrow H(D,D)$  accepts  $\Leftrightarrow D(D)$  loops...**  
**(by assumption) (by def of D)**

# Limits on Oracle TMs

**“Theorem”** There is an *infinite hierarchy* of unsolvable problems!

*Given ANY oracle  $O$ , there is always a harder problem that cannot be decided with that oracle  $O$*

$\text{SUPERHALT}^0 = \text{HALT} = \{ (M,x) \mid M \text{ halts on } x \}.$

$\text{SUPERHALT}^1 = \{ (M,x) \mid M, \text{ with an oracle for } \text{HALT}_{\text{TM}}, \text{ halts on } x \}$

$\text{SUPERHALT}^n = \{ (M,x) \mid M, \text{ with an oracle for } \text{SUPERHALT}^{n-1}, \text{ halts on } x \}$

# Self-Reference and the Recursion Theorem

**Lemma:** There is a computable function  
 $q : \Sigma^* \rightarrow \Sigma^*$  such that for every string  $w$ ,  
 $q(w)$  is the *description* of a TM  $P_w$  that on  
every input, prints out  $w$  and then accepts

**“Proof”** Define a TM  $Q$ :

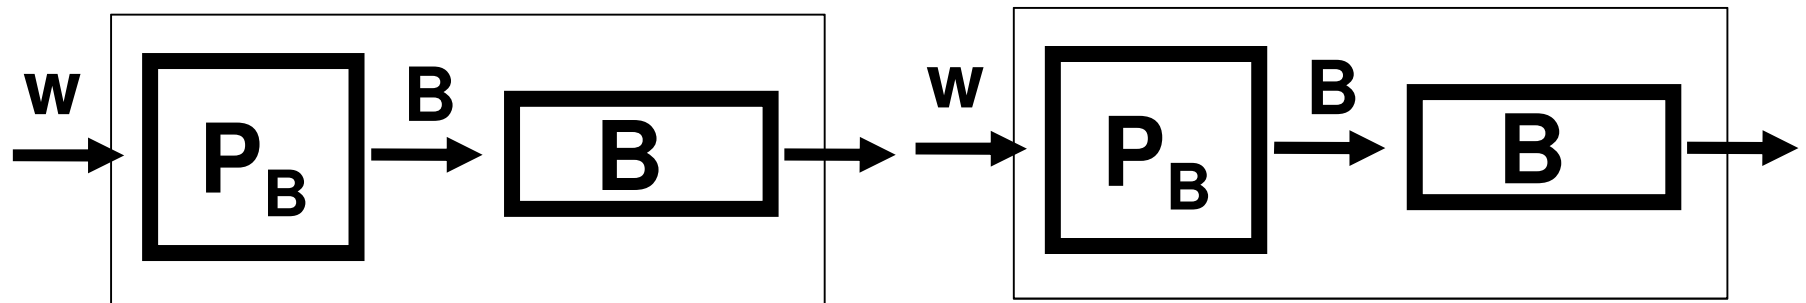

**Theorem: There is a Self-Printing TM**

**Proof: First define a TM B which does this:**

**Now consider the TM that looks like this:**

**No explicit self-reference here!**

**QED**

# The Recursion Theorem

**Theorem:** For every TM  $T$  computing a function

$$t : \Sigma^* \times \Sigma^* \rightarrow \Sigma^*$$

there is a Turing machine  $R$  computing a function

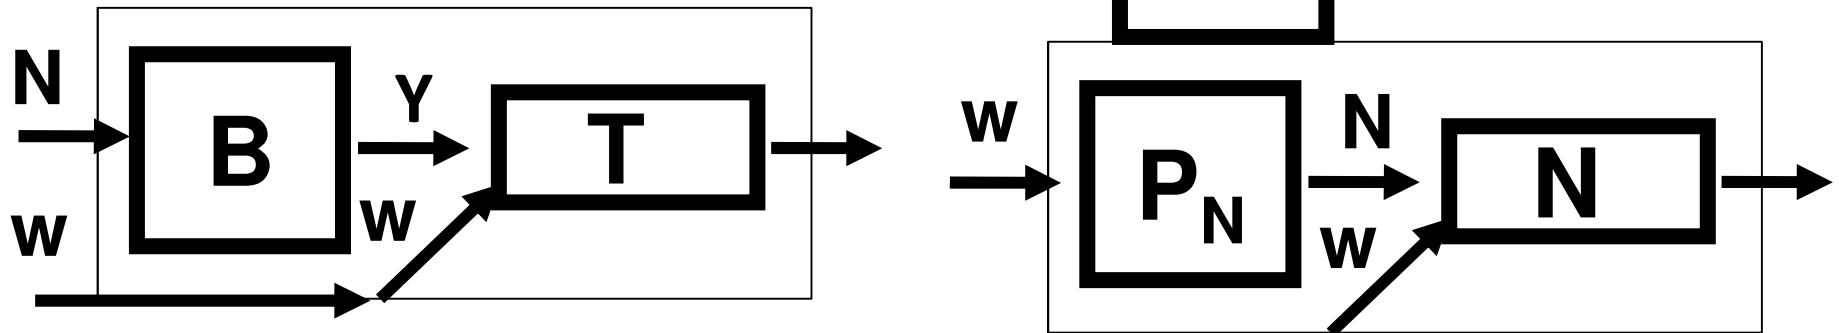

$r : \Sigma^* \rightarrow \Sigma^*$ , such that for every string  $w$ ,

$$r(w) = t(R, w)$$

Proof:  $(a,b) \rightarrow \boxed{T} \rightarrow t(a,b)$

Define  $M =$

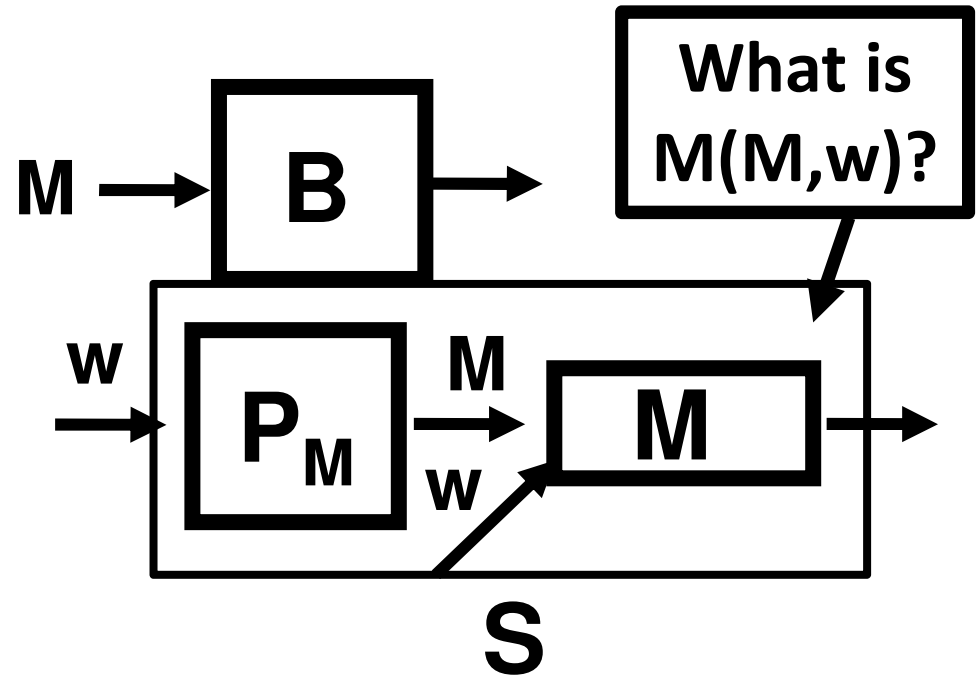

Define  $R$ :

Proof:  $(a,b) \rightarrow \boxed{T} \rightarrow t(a,b)$

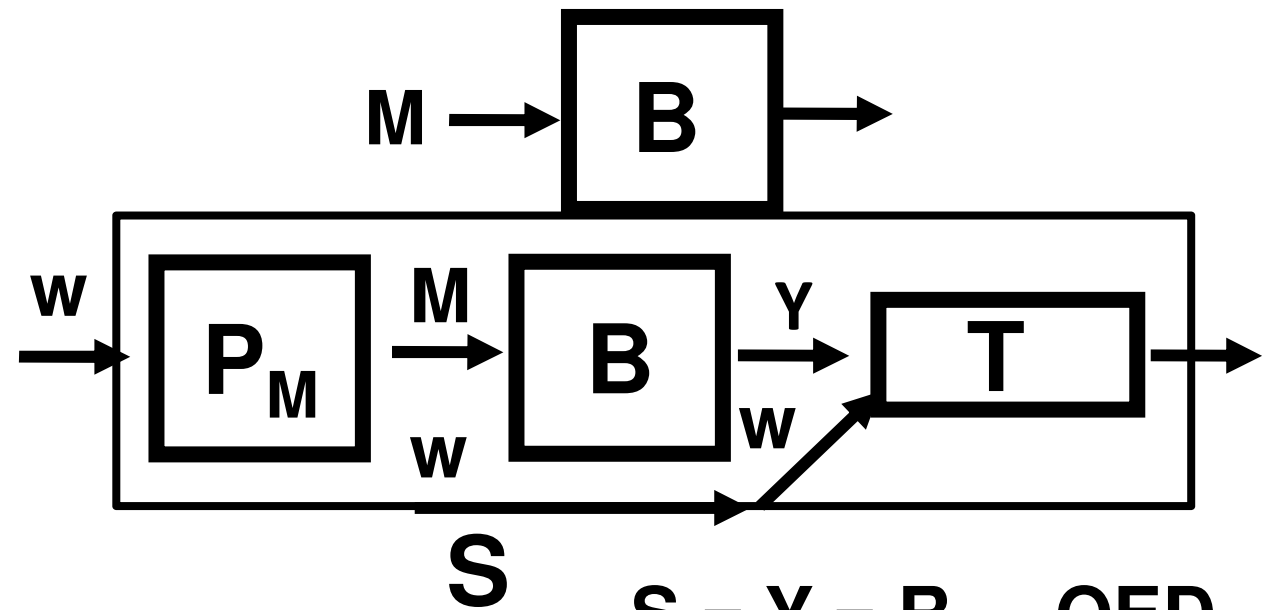

Define  $M =$

Define  $R:$

**Proof:**  $(a,b) \rightarrow \boxed{T} \rightarrow t(a,b)$

**Define R:**

$S = Y = R.$  QED

**For every computable  $t$ , there is a computable  $r$  such that  $r(w) = t(R, w)$  where  $R$  is a description of  $r$**

**Suppose we can design a TM  $T$  of the form:**

***“On input  $(x, w)$ , do bla bla with  $x$ ,  
do bla bla bla with  $w$ , etc. etc.”***

**We can then find a TM  $R$  with the behavior:**

***“On input  $w$ , do bla bla with (a description of  $R$ ),  
do bla bla bla with  $w$ , etc. etc.”***

**We can use the operation:**

***“Obtain your own description”***  
**in Turing machine pseudocode!**

**Theorem:  $A_{TM}$  is undecidable**

**Proof (using the recursion theorem)**

**Assume  $H$  decides  $A_{TM}$**

**Construct machine  $B$  such that on input  $w$ :**

- 1. Obtains its own description  $B$**
- 2. Runs  $H$  on  $(B, w)$  and flips the output**

**Running  $B$  on input  $w$  always does the  
opposite of what  $H$  says it should!**

**A formalization of “free will” paradoxes!**

**No single machine can predict behavior of all others**
